RE: Studor Air Admittance Valves

Dear Pat:

As you are aware we have been specifying Studor air admittance valves since the IPC allowed the installation of air admittance valves. Our experience with the installation has been nothing but extremely successful. Not only are the devices reliable but anytime there have been questions or concerns IPS support staff has been outstanding.

We have designed literally two dozen or more projects with Studor air admittance valves as the primary venting system. Additionally of projects designed with air admittance valves we have utilized the PAPA device in four high rise projects. All of these projects have been successful.

We believe that by designing systems around air admittance valves not only provides the owner with a quality DWV system but also a very cost effective system.

If you have any questions regarding the above information, please contact this of office.

Sincerely,

BA Consultants, Inc.
